

PCBA SPONSORSHIP REQUEST

Hack The Badge

Request for JLCPCB sponsorship of approximately 10 fully assembled PCBA units for MSG CTF

Requester: Aegis Security Team / MSG CTF

Request type: PCB fabrication, component procurement, SMT assembly, and delivery support

Requested quantity: Approximately 10 completed units

Delivery destination: Republic of Korea

Schedule request: Preferably within 7 days; absolute maximum 14 days after production approval

Design status: Circuit and PCB design completed; production files are available for review

Request Summary

Hack The Badge is an interactive cybersecurity badge project operated by the Aegis Security Team for the MSG CTF finals booth. Participants connect to the badge over USB Serial and solve cybersecurity challenges embedded in the badge experience.

We are requesting JLCPCB sponsorship support for approximately 10 fully assembled PCBA units. In this document, completed units means assembled PCBA boards ready for project-side firmware loading and event preparation. This request does not ask JLCPCB to provide an enclosure, retail packaging, or firmware programming unless those services are separately offered and confirmed.

Item	Request / current status
Requested support	PCB fabrication, parts, component procurement, SMT assembly, and delivery support as available from JLCPCB.
Quantity	Approximately 10 completed PCBA units.
Timing	Please confirm whether completion and delivery to South Korea is possible within 7 days if feasible, or within 14 days at the latest.
Design status	Circuit and PCB design are completed. This is a production feasibility and urgent schedule request, not a pre-design review.
Destination	Republic of Korea.

Production Files Available For Review

The current project folder includes JLCPCB-oriented manufacturing outputs. These files can be provided for immediate review. The attached manufacturing package is available for immediate review. The requested sponsorship production quantity is approximately 10 units.

File / artifact	Status	Notes
Gerber ZIP	Available for immediate review	JLCPCB fabrication package is present in the project folder.
JLCPCB BOM CSV	Available for immediate review	Current SMT assembly BOM is present; live stock and pricing should be rechecked by JLCPCB.
JLCPCB CPL CSV	Available for immediate review	Current component placement file is present for review.
Manufacturing validation	Available for immediate review	Local validation report is present and records the available package state.
Manual assembly list	Available for immediate review	OLED1 is listed separately in the current package; please confirm whether JLCPCB can support it for completed PCBA units.

Hardware Scope

The badge is based on an ESP32-S3-WROOM class MCU and is designed as a USB-powered interactive CTF device. The main participant interface is USB Serial, with additional intentional challenge pads for UART/GPIO interaction.

Subsystem	Included in the design
Controller	ESP32-S3-WROOM series module
USB and power	USB-C device connector and required power/protection circuitry.
User interface	OLED display, tactile switches, and LEDs.
Challenge interface	UART/GPIO challenge pads and required protection components.
Assembly target	Fully assembled PCBA boards. Please confirm whether OLED sourcing/placement can be included by JLCPCB.

Requested Sponsorship Scope Confirmation

Please confirm which parts of the production and delivery scope JLCPCB may be able to sponsor or discount. Partial sponsorship is still useful if full coverage is not available.

Scope area	Confirmation requested from JLCPCB
PCB fabrication	Can JLCPCB sponsor or discount the PCB fabrication cost for approximately 10 units?
Component cost	Can JLCPCB sponsor or discount the electronic component cost?
Component procurement	Can JLCPCB procure all listed PCBA components, or identify parts requiring substitution/approval?
SMT assembly	Can JLCPCB sponsor or discount SMT assembly for the requested quantity?
OLED / non-SMT handling	Can JLCPCB support the OLED as part of completed PCBA units, or should it remain outside JLCPCB assembly?
Shipping	Can JLCPCB sponsor, discount, or expedite shipping of the completed PCBA units to South Korea?

Urgent Schedule Confirmation

The project is intended for use at the MSG CTF finals booth. Please confirm the fastest realistic schedule after file review and production approval. We are specifically asking whether completed PCBA units can be fabricated, assembled, and shipped to South Korea within the following windows.

Schedule window	Requested confirmation
Preferred	Completion and delivery to South Korea within 7 days if feasible.
Maximum acceptable	Completion and delivery to South Korea within 14 days at the latest.
If not feasible	Please provide the earliest realistic production and delivery schedule and identify the bottleneck.

Review Questions For JLCPCB

- Can JLCPCB support approximately 10 completed PCBA units for this Hack The Badge project?
- Can the available Gerber, BOM, and CPL files be reviewed immediately for production feasibility?
- Which cost areas can JLCPCB sponsor or discount: PCB fabrication, parts, procurement, SMT assembly, or shipping?
- Is the 7-day preferred schedule possible, including shipment to South Korea? If not, is 14 days possible?
- Are there any components that require substitution, stock confirmation, or special handling before production approval?
- Can JLCPCB include the OLED in the completed PCBA scope, or should the OLED remain a separate project-side assembly step?
